Web Phishing Detection

### **LITERATURE SURVEY**

According to this paper we people are highly dependent on the internet. For performing online shopping and online activities like banking, mobile recharge and more activities are done only through internet. Here phishing is nothing but a type of website threat which illegally collects the original website information such as login id, password and credit card information. Here we will use an efficient machine learning based web phishing detection technique

#### **Problem Identification**

There are many users who purchase products through online platform and the payment is done through e-banking.

There are some fake banking websites in which they collect the more sensitive information like username, password, credit card details etc , for illegal purpose.

This type of websites are called phishing website.

Here web phishing is one of the security threat to webservices on the internet.

#### **Problem Solution**

To overcome the problem of phishing website whenever we are clicking on one website it must show an alert box like it is a secure website or it is not a secure website.

Then another way is that we can scan the website in order to prevent our system or mobile from the phishing attack.

Even though technologies are there we as the user have to be aware of the websites whether it is secure or not. We should not click any unwanted websites.

### **CONCLUSION**

This paper aims to enhance detection method to detect phishing website using machine learning technology. Also , classifiers generated by machine learning algorithms identify legitimate phishing websites. The proposed technique can detect new temporary phishing sites and reduce the damage caused by phishing attacks. The performance of the proposed technique based on machine learning is more effective than previous phishing detection technologies. In the future, it will be useful to investigate the impact of feature selection using various algorithms.
